

MICROWIPE

GENERAL PURPOSE WEEDWIPER

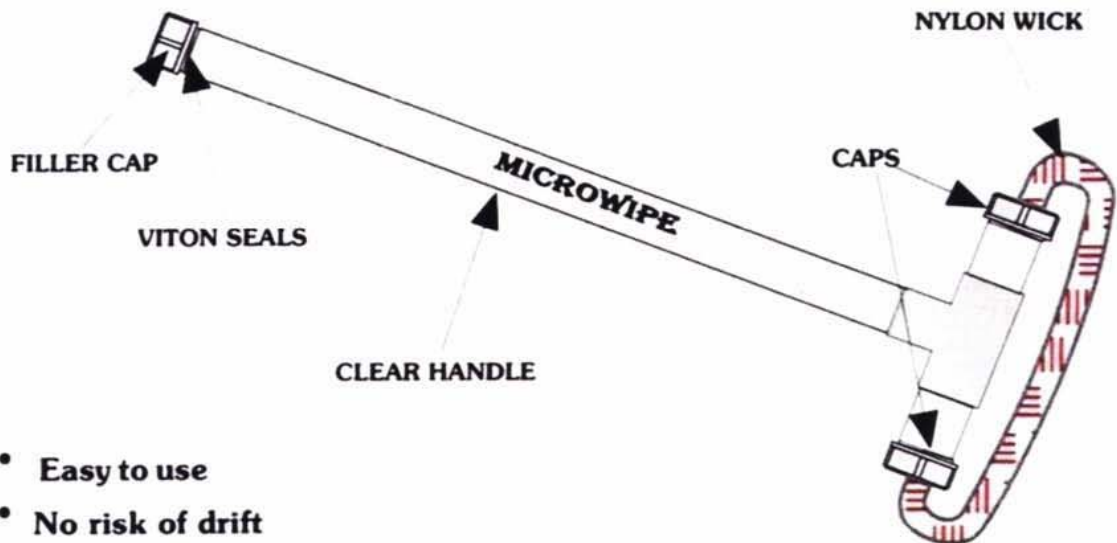

NEW

The hand held Microwipe has been specially developed for the selective application of systemic herbicides and is particularly suitable for those herbicides containing glyphosate e.g. Roundup.

The Microwipe has significant advantages over conventional methods of application such as knapsack sprayers for spot applications or treating sensitive areas. The concentrated herbicide within the Microwipe is applied only to those plants that the rope wick comes into contact with. By moving the Microwipe over the leaves of a weed, a small dose of herbicide is transferred to the target weed only, with surrounding plants uncontaminated. The Microwipe is therefore ideal for treatment of weeds in row crops, vegetable gardens, between grape vines, around trees, or any other place where conventional treatment would be too dangerous or difficult.

The Microwipe gives excellent results when used on individual weeds or clumps of weeds. The first effects will generally be seen 1 - 2 weeks after treatment when using glyphosate based herbicides.

- Easy to use
- No risk of drift
- No contamination of soil
- Economical
- Minimal water requirement
- Safe to use in dense crop

SPECIFICATION

Capacity:	0.21L
Handle material:	Clear plastic
Wick material:	Nylon
Seals:	Viton
